Magnetic Stimulation in Clinical Neurophysiology Frontiers Media SA

This book sheds new light on central pain, a field that is largely obscured by lack of knowledge among pain professionals at all levels, including high-end pain centers. As a matter of fact, central pain, classified as a form of neuropathic pain, remains too often a scourge for those affected due to the ignorance of pain therapists worldwide and enduring misconceptions at the academic level. By weighing up the relevant evidence, the authors aim to remedy the situation by providing clear-cut, no-nonsense, unbiased and directly applicable clinical information. The clinically sound guidelines presented here are based on the authors' twenty years of treating patients and conducting research in the field. The book will be an invaluable guide for neurologists, neurosurgeons, anesthesiologists, pain therapists as well as physiotherapists.

In diesem Buch wird ein anwendungsfreundliches, psychologisches Profiling für Trainer im Gerätturnen vorgestellt, um Turner/innen in unterschiedlichen psychologischen Bereichen einschätzen zu können. In einem ersten Schritt werden wissenschaftliche Erkenntnisse für den theoretischen Hintergrund aufgegriffen. Dazu werden sportartunspezifische als auch gerätturnspezifische Tests dargestellt und erläutert, Vor- und

Nachteile dargestellt und mit Bezug auf die Problemstellung der Arbeit eingeordnet. Aufbauend auf dem theoretischen Hintergrund werden gerätturnrelevante Dimensionen ausgearbeitet. Daraufhin entsteht eine erste Version des MST-Gym mit 70 Items. In einem nächsten Schritt werden die erfassten Daten ausgewertet, unbrauchbare Items aussortiert und eine neue Version des MST-Gym mit 40 Items gefertigt. Zugleich werden Normen für signifikante Gruppen erarbeitet. Mit diesen Normtabellen ist eine Einklassifizierung jedes/jeder einzelnen Turners/Turnerin möglich. Der Fragebogen MST-Gym 40 ist im Buch enthalten.

This book is an in depth guide to chronic and neuropathic pain. The issue of chronic and neuropathic pain is very prevalent, yet only a fraction of the symptoms and root causes, as well as potential treatment plans, are properly understood. Additionally,

less than half of cases are accurately identified and properly treated. The existing drugs, although classified as very strong and powerful, cannot provide lasting relief to chronic and neuropathic pain. Thus, with all the unique features of this condition, this book presents a systematic way of diagnosing and approaching this condition so every practitioner can appropriately treat their patients. In addition to introducing key concepts, like classification of chronic pain and the challenges patients and practitioners face when dealing with and treating chronic and neuropathic pain, this book also covers different syndromes that can lead to neuropathic pains. It discusses how to monitor progress by using outcome measures, the presence of chronic and neuropathic pain in children and young adults, and the pathophysiology of neuropathic pain as it relates to the release of pro-inflammatory cytokines. Interestingly, the latter is not presently addressed except with the usual pain drugs for general pain—this book aims to revolutionize the approach to chronic and neuropathic pain by exploring it separately from the clinical approach to general pain. It is interesting to note that these cytokines require a specific mode of action if we want to neutralize them in our system, and this concept will be discussed in the regenerative intervention sections. Since it is so necessary to address the many factors to chronic and neuropathic pain as laid out in the proposed table of contents, it is also critical include as varied authors as possible to address this condition from all areas being covered. The team assembled to author the chapters included in this text come from diverse backgrounds of practice and clinical and research interests, from physical medicine and rehabilitation to anesthesiology to radiology and interventional pain medicine. This is an ideal guide for all clinicians caring for patients with chronic and neuropathic pain.

The Sensing Brain: The Role of Sensation in Rehabilitation and Training Elsevier Health Sciences

The new technological advances opened widely the application field of robots. Robots are moving from the classical application scenario with structured industrial environments and tedious repetitive tasks to new application environments that require more interaction with the humans. It is in this context that the concept of Wearable Robots (WRs) has emerged. One of the most exciting and challenging aspects in the design of biomechanics wearable robots is that the human takes a place in the design,

this fact imposes several restrictions and requirements in the design of this sort of devices. The key distinctive aspect in wearable robots is their intrinsic dual cognitive and physical interaction with humans. The key role of a robot in a physical human-robot interaction (pHRI) is the generation of supplementary forces to empower and overcome human physical limits. The crucial role of a cognitive human-robot interaction (cHRI) is to make the human aware of the possibilities of the robot while allowing them to maintain control of the robot at all times. This book gives a general overview of the robotics exoskeletons and introduces the reader to this robotic field. Moreover, it describes the development of an upper limb exoskeleton for tremor suppression in order to illustrate the influence of a specific application in the designs decisions.

The world is full of uncertainty. In unpredictable circumstances, can emotions facilitate advantageous decision-making? A

neuroscience team, led by Antonio Damasio, explored this question using the Iowa Gambling Task (IGT). To the present day, the findings of numerous IGT-related investigations strongly influence clinical and interdisciplinary research, for example, in neuroeconomics and neuromarketing. This special issue examines IGT-based research progress over the past 20 years through literature reviews, clinical examinations, model construction, theoretical integration, and brain imaging technology. Both supportive and opposing viewpoints are provided to frame correlations between rationality, emotion, decision-making, and IGT. Potential future directions for IGT studies are discussed Central Pain Syndrome Frontiers Media SA
